

WATER CONSERVATION & IRRIGATION EFFICIENCY

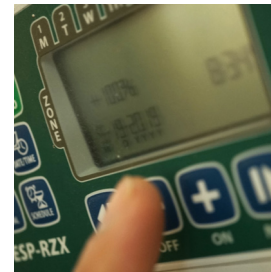

Conserving Water. Sustaining Brands.

The demand for fresh water has doubled over the past 50 years—it's more precious now than ever. EMCOR Facilities Services (EFS) helps customers achieve their water conservation goals, while keeping their brand images pristine. For businesses, water efficiency isn't just playing a major role in reducing cost; it's also having a much greater impact on a company's brand perception.

WATER CONSERVATION & IRRIGATION EFFICIENCY

Achieve up to 85 Percent Efficiency. The average irrigation system is only about 50 percent efficient. An EFS irrigation-efficiency program can increase that to nearly 85 percent.

Why EFS?

- Expertise in every region and climate across the U.S.
- Visibility of spend to identify areas needing improvement
- Water-efficient irrigation systems
- New installs or retrofits
- Cost savings realized quickly
- Xeric landscaping options
- Help mitigate risk and ensure compliance
- Consolidated services under a single 4-season plan
- Reconcile just one invoice, not several

Smarter Irrigation Keeps the Savings Flowing.

EFS helps save customers serious money with up to 50 percent more efficient, sensor-triggered sprinkler heads.

Centrally Controlled Solutions.

Nozzle Retrofits: Retrofitted nozzles use up to 33 percent less water than traditional spray nozzles. This solution is typically the most affordable and creates the biggest return on investment. Head bodies can cover areas anywhere from four to thirty feet.

Weather Controller: EFS professionals tap into weather stations that monitor the elements at customer sites 24/7/365, and calculate moisture lost from plants based on temperature, wind conditions, humidity, precipitation, and solar exposure. EFS utilizes small, mountable, self-contained fixtures that gather weather data for evapotranspiration (ET) calculations in the controller. EFS professionals use wireless technology and adjustable rain gauges to ensure all “free” precipitation is captured.

Integrated Flow Sensor: With special flow sensors, EFS can detect and measure the water movement in irrigation systems. Sensors make it easy to catch (and alert customers to) a broken head, pipe, or stuck valve—all of which waste staggering amounts of water.

Maximum Efficiency. Maximum Savings.

According to the Carbon Disclosure Project’s (CDP) Water Disclosure Report, roughly 40 percent of companies said they have experienced water-related risks in the last five years. With a relatively small investment, EFS customers can conserve more water through irrigation efficiency. By working with EFS professionals who understand how to leverage maximum efficiency from customers’ current systems, we help craft a cost-effective solution to help dramatically reduce water consumption.

Critical Steps to Water Conservation

- Eliminate run-off from impenetrable surfaces
- Minimize over-spray outside the landscape
- Ensure matched precipitation rates in each hydrozone
- Discover and manage waste with technology
- Apply water with greater uniformity
- Resist distortion of uniformity from wind
- Adjust watering frequency to match the current weather
